Project Title: Todo App

Description: A todo list built following atomic design with Next.js and Tailwind.

Stack

- Next.js (React Framework)
- Tailwindcss (inline css styling)

Purpose

→ The reason why the project is being undertaken and its intended benefits.

- This project has as objective showcase my abilities with front-end development through the delivery of a todo list application.
- In this project I should be able to apply concepts and principles common and necessary to the development of great software.

Objectives

→ Clear, specific goals that the project aims to achieve.

- Provide an application where the user can manage their tasks over their agenda.

Scope

→ A high-level overview of what the project will deliver and the boundaries of the project.

- The app will enable the user to manage tasks and only tasks at first.
- The app will store the tasks locally, not enabling cloud storage at first. This is only the MVP, and nothing blocks us from incrementing the app throughout time.
- The app will be a true single page application.

Requirements

→ Major requirements that the project needs to satisfy.

- The user should be able to create a new task.
- The user should be able to see a list with its tasks.
- The user should be able to mark a task as completed.
- The user should be able to delete all the completed tasks from the list.
- The user should be able to define a date to the tasks.
- The system should persist the tasks locally.
- The interface should be responsive.
